

Making Smart Home Technology SIMPLE!

By Dennis Lane, Accurate Electronic Interiors

Intelligent Lighting Control

Intelligent lighting control systems are designed to give you a level of command and innovation that goes far beyond the ability to easily adjust the lights in your home.

Eco-friendly total lighting control that acts in your best interest whether you are home or away:

- Automated lighting control integrates with motion sensors to dim or turn off lights when a room is unoccupied.
- Configure specific intelligent lighting to go on at sunset and off at daybreak.

- With one touch initiate a "Goodnight" scene to deactivate all interior lights as exterior floodlighting is turned on.
- Remotely monitor and adjust home lighting control status throughout the house while away from home using your Smart Phone, iPad or laptop.

Wired or Centralized Lighting

Designing your lighting control system when in the new construction phase makes it even easier to get the most control with the least visual impact on the room's décor. Centralized lighting systems allow you to hide all the dimming modules in a cabinet somewhere out of the way. Now banks of switches become single, elegant keypads or sleek touch screens. Lutron offers hardwired centralized lighting solutions for automating and controlling LEDs, track lighting, incandescent, floor/table lamps, sconces, spotlights, and even outdoor lighting for your home.

Wireless Lighting

Wireless dimmers make it easy to enhance your lighting controls without any rewiring/remodeling and without compromising reliability. They install like ordinary wired dimmers, allowing you to set "scenes" on a keypad and control lights using the wires already in your walls. The difference is you can now also adjust your lights from your favorite mobile device or computer using wireless control. Lutron offers solutions for automating and controlling LEDs, track lighting, incandescent, floor/table lamps, sconces, spotlights, and even outdoor lighting...wirelessly.
